

Reducing a fraction means to make the existing numerator and denominator as small as possible while keeping the fraction equivalent. In our example we can divide the original fraction by 2 to get the lowest terms. The number 2 is the largest number (factor) that can be divided from both 4 and 6.

$$\frac{4}{6} \div 2 = \frac{2}{3}$$

$$\frac{\quad}{\quad} \div \frac{\quad}{\quad} = \frac{\bigcirc}{\bigcirc}$$

$$\frac{\quad}{\quad} \div \frac{\quad}{\quad} = \frac{\quad}{\quad}$$

$$\frac{\quad}{\quad} \div \frac{\quad}{\quad} = \frac{\quad}{\quad}$$

$$\frac{\quad}{\quad} \div \frac{\quad}{\quad} = \frac{\quad}{\quad}$$

$$\frac{\quad}{\quad} \div \frac{\quad}{\quad} = \frac{\quad}{\quad}$$

$$\frac{\quad}{\quad} \div \frac{\quad}{\quad} = \frac{\quad}{\quad}$$

$$\frac{\quad}{\quad} \div \frac{\quad}{\quad} = \frac{\quad}{\quad}$$

$$\frac{\quad}{\quad} \div \frac{\quad}{\quad} = \frac{\quad}{\quad}$$

$$\frac{\quad}{\quad} \div \frac{\quad}{\quad} = \frac{\quad}{\quad}$$
